C.Comment: The MG3 precursor sequence is shown.
C.Complex: An immunoglobulin heterotetramer submit consists of two identical light (kap hain disulfide bonds. In some cases, such as 1gA and 1gM, the subunits associate into la C.Superfamily: immunoglobulin V region; immunoglobulin homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               R;Burstein, Y.; Schechter, I.

MYOSIN IS A PROTEIN THAT BINDS TO
F-ACTIN AND HAS ATPASE ACTIVITY THAT IS ACTIVATED BY F-ACTIN.
C -1- SUBMUT: MUSCLE MYOSIN IS A HEXAMENC PROTEIN THAT CONSISTS OF 2
HEAVY CHAIN SUBMUTS (MAC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)
AND 2 REGULATORY LICHT CHAIN SUBMUTS (MLC-2).
C -1- SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.
C -1- DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING
C CYCLES OF A 28-RESTOUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES,
C CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.
C -1- PTM: TWO CYSTERINE RESIDIES IN THE SI DOMAIN ARE SELECTIVELY
ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.
C -1- MISCELLANGOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT
MEROMYOSIN (LMM) AND 1 HEAVY MEROMYOSIN (HMM). IT CAN LATER BE
C SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (SI) AND 1 ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBFRAGMENT (S2).

01-OCT-2000 (Rel. 40, Last annotation update)
NICOINAMDE-NUCLEOTIDE ADBNYLXITERANSFERSE (EC 2.7.7.1) (NAD(+)
PYROPHORYLASE) (NAD(+) DIPHOSPHORYLASE) (NAN ADENYLXITERANSFERASE).
DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMEDSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COLLED COLLS.

PHY: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY MISCELLANGOUS: EACH MOSIN (HAN) CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LMM) AND I HEAVY MEROMYOSIN (HMM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (SI) AND I ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Archaea; Euryarchaeota; Thermococcales; Thermococcaceae; Pyrococcus NCBL_TaxID=29292;

Viscogliosi E., Durienx I., Delgado-Viscogliosi P., Bayle D., Dive D.;
"Phylogenetic implication of iron-containing superoxide dismutase
genes from trinchomonad species."

Mol. Biochem. Parasitol. 80:209-214(1996).

-I- FUNCTION: DESTROYS RADICALS WHICH ARE NORMALLY PRODUCED WITHIN THE
CELLS AND ARE TOXIC TO BIOLOGICAL SYSTEMS (BY SIMILARITY).

-I- CATALYITC ACTIVITY: 2 PEROXIDE RADICAL + 2 H(+) = O(2) + H(2)O(2).

-I- COFACTOR: COPPER AND ZING OR IRON OF MANGANESE.

-I- SIMILARITY: BELONGS TO THE IRON/MANGANESE SUPEROXIDE DISMUTASE
                                                                                                                                                                                                          SECUENCE FROM N.A.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0;
                                                                                                                                                                         binding to a varicella zoster virus (VZV) can be used to treat or prevent VZV infection. They may optionally be attached to a therapeutic agent. They may also be used, when labelled, to detect VZV particles and infected cells in blood; for the removal.

Convertablisation of infections VZV in blood; for the selection.

Considerion of human monoclonal Abs and for the design of (non-) peptide mimetics with similar diagnostic and therapeutic uses. The contral period of provider is design of the portion is derived from murine Ab 206 and the neavy and light chain variable region frameworks are NEWM and REI caspectively. The framework may include at least one mutation that improves binding specificity or affinity. The heavy and light chain cariable regions are preferably (VZVUH-VH, -VHKFIIS, -VHTLY, -VHKVRSE or -VHS) and VZVHUVK respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Varicella zoster virus gpIII antibody with humanised variable region - for treatment, prevention or diagnosis of varicella zoster virus infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

Peptides AAR75462-92 are examples of complementarity determining regions (CDRs) used to generate antibodies against immunorecessive antigens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer; amplification; PCR; mouse; kappa chain; heavy chain; Fab; antibody; immunotolerance; animal; variegated display library; CDR; variable region; antigen; immunorecessive; cell surface marker; foetal; cancer; stem cell; variant; therapy; Alzheimer's disease; hybridoma; familial hypercholesterolaemia; binding affinity;
                                                                                     princing to a varicella zoster virus (VZV) can be used to treat or prevent VZV infection. They may also be used, when labelled, to detect VZV particles and infected cells in blood: for the removal/ variation of infectious VZV in blood: for the selection/ isolation of human monoclonal Abs and for the design of (non-) peptide minetics with similar diagnostic and therapeutic uses: The variable region CDR portion is derived from murine Ab 206 and the heavy and light chain variable region frameworks are NEWM and REI respectively. The framework may include at least one mutation that improves binding specificity or affinity. The heavy and light chain variable regions are preferably (VZVHu-VH, -VHKVRSE or -VHS) and VZVHUVK respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The CDRs are derived from the heavy and light chain variable regions of the antibodies PB3-2 (AAQ92500-1), F4-7 (AAQ9502-3) and H3-3 (AAQ92504-5). The peptides AAR75470-81 represent CDR3 from the light chain variable regions. The CDR sequences were isolated from a variegated display library (VDL) of variable regions derived from a repertoire of antibodies from an immunotolerised animal. The VDL is generated by PCR amplifying the variable regions from the antibody coding sequences using the primers AAQ74153-74. The constructed antibodies are on a foetal, cancer or stem cell, which can differentiate between variant the AACP4161 variable regions from a foetal, cancer or stem cell, which can differentiate between variant of the antigen. The antibodies generated can be used in
                                                                                                                                                                                                                                                                                                                                              the diagnosis, e.g. detection of the immunorecessive antigen, or in therapy e.g. of cancer, Alzheimer's disease or familial hypercholesterolaemia. The method of production of the antibody allows rapid and sensitive isolation of antibodies that would be difficult to isolate by standard methods. The antibodies produced have greater binding affinity than those produced by combinatorial/hybridoma methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9 AA;

Microbially expressed portions of monoclonal antibody - can attachment of rhinovirus ligands to inter-cellular adhesion molecule (ICAM-1)

can block

Claim 1; Page 20; 28pp; English.

This is one of six antibody fragments from Mab's specific for domain 1 of ICAM-1. The peptide fragments can be used to treat or prevent rhinovirus infection. See AAR15437-R15443.

Monoclonal antibodies specific for different epitope(s) on human gp39 - used for inhibiting B cell activation and for the diagnosis of various disorders, e.g. cancer, psoriasis etc..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the light chain variable region of the murine anti-human glycoprotein (gp) 39 monoclonal antibody (MAb) 39-17 (a member of the murine kappa II subfamily). The MAb was prepd. by immunisting a 6-8 week old BALD/C mouse with a gp39-CD8 fusion protein, and 3 days later harvesting and fusing spleen and lymph cells to mouse melanoma cells, to produce an anti-human gp39 MAAb producing hybridoma. The MAb may be useful for diagnosing disease states, inhibiting B-cell activation and for treating immunological disorders, e.g. autoimmune disorders, allergic responses, organ rejection and graft versus sp39 on their surface, e.g. tumour cells, and to target therapeutic agents to such cells.

The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; nootropic; neuroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     open reading frame; ORFX; detection; cytostatic; hepatotropic;
The MAD inhibits the CD40/gp39 interaction, therefore limiting both pyfim. and sec. responses to T-cell dependent antigens and Ab prodn. specific to these antigens. A typical compsn. for intramuscular injection pref. contains 50 mg of MAD in 1 ml of sterile buffered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acids and peptides derived from open reading frame X,

Peptides AAR75462-92 are examples of complementarity determining regions (CDRs) used to generate antibodies against immunorecessive antigens.
            immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiloflammatory; antibacterial; antiviral; antifungal; antitheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The
                                                                                                                            nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance coagulation; to inhibit thrombosis; and as a contraceptive.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Primer; amplification; PCR; mouse; kappa chain; heavy chain; Fab; antibody; immunotolerance; animal; variegated display library; CDR; variable region; antigen; immunorecessive; cell surface marker; foetal; cancer; stem cell; variant; therapy; Alzheimer's disease; hybridoma; familial hypercholesterolaemia; binding affinity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Generating new antibodies specific for immunorecessive epitopes by selection from variegated V gene library cloned from immuno:tolerance derived antibody repertoire, useful in diagnosis,

The CDRs are derived from the heavy and light chain variable regions of the antibodies FB3-2 (AAQ92500-1), F4-7 (AAQ92502-3) and H3-3 (AAQ92500-5). The peptides AAR75470-81 represent CDR3 from the light chain variable regions. The CDR sequences were isolated from a repertoir of antibodies from a immunotolerised animal. The VDL is generated by PCR amplifying the variable regions from the antibody coding sequences using the primers AAQ74153-74. The constructed antibodies are generated against an immunorecessive antigen e.g. a cell surface marker on a foetal, cancer or stem cell, which can differentiate between variant or related forms of the antigon. The antibodies generated can be used in the diagnosis, e.g. eq. detection of the immunorecessive antigen, or in
                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                    therapy e.g. of cancer, Alzheimer's disease or familial hypercholesterolaemia. The method of production of the antibody allows rapid and sensitive isolation of antibodies that would be difficult to isolate by standard methods. The antibodies produced have greater binding affinity than those produced by combinatorial/hybridoma methods.
                                                                                                                                                                                                                                                                                                                                                                                                ;

This is obtained by comparing a donor and human immunoglobulin and producing a combined antibody which contains part of each. These are useful in the treatment of graft-versus-host disease, transplant rejection, autoimmune diseases such as diabetes, rheumatoid arthritis, myasthenia gravis, multiple sclerosis and systemic lupus erythematosus, herpes infections, CMV virus infections demonstrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Humanised immunoglobulin; mouse; human; antibody; heavy chain; diabetes; light chain; graft versus host disease; transplant; autchimmune disease; multiple sclerosis; rheumatoid arthritis; systemic lupus erythematosus; myasthenia gravis; herpes infection; myeloid leukaemia; CMV infection.
human Pom framework to produce a pure humanised immunoglobulin (Ig) which is capable of binding to a herpes simplex virus-specific epitope. The Ig is non immunogenic, due to the human framework, and has a strong affinity for its predetermined antigen. They can be produced in large quantities via recombinant DNA and monoclonal antibody technology. The humanised Igs may be used alone or in combination with chemotherapeutic agents such as non-steroidal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         containing DNA segments encoding humanized heavy and light chain
variable regions, and expressing the DNA segments in the cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method of producing humanised immunoglobulins involving expressing in a cell a nucleic acid encoding a humanised version of an immunoglobulin. This is obtained by comparing a donor and human immunoglobulin and producing a combined antibody which contains part of each. These are useful in the treatment of graft-versus-host disease, transplant rejection, autoimmune diseases such as diabetes, rheumatoid arthritis, myasthenia gravis, multiple sclerosis and systemic lupus erythematosus, herpes infections, CMV virus infections and myeloid leukaemia. The present sequence is an antibody used to demonstrate the method of the invention.
                                                                                                                                                                                                                Humanised immunoglobulin; mouse; human; antibody; heavy chain; diabetes; light chain; graft versus host disease; transplant; autoimmune disease; multiple sclerosis; rheumatoid arthritis; systemic lupus erythematosus; myasthenia gravis; herpes infection; myeloid leukaemia; CWV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing humanized immunoglobulin, involves producing a cell containing DNA segments encoding humanized heavy and light chain variable regions, and expressing the DNA segments in the cell -

AAR75457
```

```
The sequence of the light chain variable region from the mouse antibody FB3-2. This sequence was isolated from a variegated display library (VDL) of variable regions derived from a repertoire of antibodies from an immunotolerised animal. The VDL is generated by PCR amplifying the variable regions from the antibody coding sequences using the primers AAQ74153-74. The variable regions, esp the complementarity determining regions (CDR; see AAR75462-93 for examples of CDRs) from the immunotolerant animals' antibodies are used to construct an antibody against a immunorecessive antigen e.g. a cell surface marker on a foetal, cancer or stem cell, which can differentiate between variant or related forms of the antigen. The antibodies generated can be used in the diagnosis, e.g. detection of the immunorecessive antigen, or in therapy e.g. of cancer, Alzheimer's disease or familial hypercholesterolaemia. The method of production of the immunorecessive antigen, or in therapy e.g. of cancer, Alzheimer's disease or familial hypercholesterolaemia. The method of production of the antibody allows rapid and sensitive isolation of antibodies that would be difficult to isolate by standard methods. The antibodies produced have greater binding affinity than

```
This invention describes a novel method for the detection of a mammalian infection by an acid-resistant microorganism (A) by treating a faecal sample with at least two different monoclonal antibodies (MAD) (or their fragments or derivatives) or aptamers (collectively (I)) and detecting formation of a complex (C) between (I) and the corresponding antigen of formation of a complex (C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens. (A). These epitopes are present, after passage through the intestines, in at least some mammals, and have either: (i) their native structure; or (ii) a structure against which an antibody is produced by an animal infected or immunized with (A), or its extract, lysate, derived protein or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect infection by acid-fast bacteria, particularly of the genera Helicobacter, Mycobacterium and Campylobacter, specifically H. pylori, H. hepaticus, confinementically. The method is direct and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigens during passage through the intestines. This sequence represents a fragment of a H. pylori heat shock protein, RSP60-binding antibody light chain complementarity determining region CDR3 which is used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting infection by acid-fast microbes for diagnosis of Helicobacter pylori, comprises reacting a faecal sample with two binding reagents for antigens that survive intestinal passage
                                                                                                                                                                                                                                                                                                                                    Acid-resistant microorganism; detection; faecal; intestine; infection; monoclonal antibody; heat shock protein; HSP60; light chain; CDR; complementarity determining region.
                                                                                                                                                                                                                                                                     H. pylori HSP60-binding antibody light chain CDR3 protein fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Friedrichs U, Heppner P, Lakner M;

The sequence encoding the variable region of the light chain of the monoclonal antibody 5EB (specific for the alpha subunit of human gonaddrophin) was amplified for its use in a recombinant vector which also comprised (1) the promoter of the gene for the neutral protease of Bacillus subtilis EGSC 1A341, (2) the secretion sequence described in AAQ17278. The amplified fragment was used to produce a DNA sequence encoding an antibody in single molecule form with the sequence VH/VK-L-VK/VH-(TAG)n, where VH and VK are the variable regions of the heavy and light chains of the antibody and List she crecognised by polyclonal light chains of the antibody and List she recognised by polyclonal antibodies directed towards the same peptide n is 1 or 0. The vector is used for the production of single chain antibodies which have improved pharmacokinetic properties and can be production of antibodies in completely soluble form with

A;Molecule type: protein
A;Residues: 1-111 <WEI>
A;Rote: the PC4285 and PC4039 sequences are identical
C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into C;Superfamily: immunoylobulin V region; immunoglobulin homology
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds.
